SORTED

More capacity. Less overhead.

We build the AI-powered infrastructure your business doesn't have time to build.

> **One operational improvement at a time.**

The work that would create capacity needs capacity to get built.

Your team runs the business.

Repetitive work consumes the time.

Infrastructure becomes another project in the queue.

> **Sorted supplies the external building function.**

Agents assist the workflow. Operators take on the job.

MANUAL

Request → Brief → Design → Copy → Assemble → Review → Publish

People carry the work and coordinate the handoffs.

AGENT-ASSISTED

Request → Brief → AI-assisted production → Human handoffs → Review → Publish

AI speeds up tasks. Your team still drives the process.

OPERATOR-LED

Approved brief → Scoped production line → Review-ready page

Operators execute the agreed steps. A person approves release where required.

Conceptual comparison. No timing, staffing or cost outcomes implied.

An operator is a scoped responsibility. Not an unrestricted assistant.

Input

What starts the job.

Actions

What it may do and access.

Output

What it must produce.

Exceptions

When it stops or escalates.

> **Routine execution does not require a person to supervise each step. Approval remains where the business needs it.**

One handoff. A practical first build.

ILLUSTRATIVE EXAMPLE: LEAD HANDLING

BEFORE

- Read enquiry
- → Qualify
- → Enter CRM
- → Prepare follow-up

OPERATOR-LED

- Capture
- → Apply agreed rules
- → Update CRM
- → Draft follow-up

> **Staff approve sensitive actions and handle exceptions.**

Compare manual effort, response time and exception rate with the baseline.

Check the campaign before it spends.

ILLUSTRATIVE EXAMPLE: ECOMMERCE CAMPAIGN READINESS

BEFORE

- Compare the offer
- → Check stock and prices
- → Test product links
- → Verify campaign tags

OPERATOR-LED

- Read approved campaign and catalogue
- → Validate offer and availability
- → Check destinations and tags
- → Flag exceptions for approval

> **Output: a launch-readiness report. People resolve exceptions and approve launch.**

Compare manual QA time and time to approval with the baseline. No ads published or budgets changed.

Find the bottleneck. Build the operator. Prove the improvement.

Map the workflow.

Agree the output and permissions.

Test with approvals and monitoring.

Compare with the baseline.

> **No predefined savings claim. Agree what success means before building.**

The value is a more capable business. Not a higher agent count.

First build

Understand the systems and rules.

Next build

Reuse the connections and context.

Over time

More output with less routine coordination.

> **Agents can help design and improve the system. Operators execute the defined work.**

Which workflow should no longer need your team to carry it?

Where is the repeated effort?

What systems and decisions does it depend on?

What would a worthwhile improvement change?

> **Next step: Operational Blueprint + proposal for one bounded operator.**

Scope, acceptance criteria and costs agreed before development.
